## 1. INTRODUCTION

Baird AE has been retained to prepare a Traffic Impact Assessment in support of the residential development in City of Windsor. The site is approximately 0.844 hectares (ha) in size and bounded by 6th Concession Road to the west, Holburn Street to the north, Spago Crescent to the south and residential development to the north and east.

The proposed development will consist of twenty-six single-family houses, a roadway and a landscape area. The site will generate an additional 248 daily, 20 morning and 26 evening peak traffic. Exhibit 1 shows the location.

**Exhibit 1 - Location Plan**

### 1.1 Scope

The development currently has a house, shed and storage buildings. All existing buildings will be removed and replaced with townhouses, a new roadway and a landscape area. Access to the site will be provided from Spago Crescent. The development is projected to be built by 2025 and as a result, the following future horizon periods (conditions) were established as part of this study:

- 2025 Future Condition;
- 2030 Short Term Future Condition; and
- 2035 Long Term Future Condition.

The following intersection were included in the study in order to determine the impact of the proposed development:

- 6th Concession Road ad Holburn Street
- Holburn Street and Zurich Avenue

## **1.2 Analysis Methodology**

A transportation analysis was completed to determine the existing and future operating conditions of intersection and individual turning movements. The operational analyses were primarily based on procedures set out in the Highway Capacity Manual (2010) with the assistance of Synchro 10. Several performance measures are used in the analysis of signalized and unsignalized intersections including the following:

- Level of Service (LOS) – a measure of the average vehicle delay experienced by the motorists attempting to travel through the intersection. LOS is measured from “A” to “F” with peak hour LOS in the “A” to “D” range being considered acceptable by most and a LOS of F representing unacceptable delays;
- Delay – the additional travel time experienced by a driver compared to free-flow conditions; and
- Queue Lengths – the Synchro Software measures both the 50th percentile and 95th percentile maximum queue lengths. The 50th percentile queue (the median) is the maximum back of queue length during a typical traffic cycle. The 95th percentile queue is the maximum back of queue length during a typical traffic cycle with 95th percentile traffic volumes. The 95th percentile queue measures the queue length that 95 percent of the sample lies below. The 95th percentile critical queue lengths were identified for movements where the queue surpassed the estimated length of the storage bay.

These measures provide an indication of delay and the number of vehicles that can be accommodated through an intersection.

## 2.0 EXISTING CONDITIONS

### 2.1 Existing Site

The existing development consists of three existing buildings. The total area of development is approximately 0.84ha.

### 2.2 Road Network Characteristics

The existing road network, lane configuration and existing traffic control for the study area are described below:

**6th Concession Road** is a local two-lane north-south roadway with a posted speed limit of 50 km/h. It has a gravel pathway on both sides.

**Holburn Street** is a local two-lane east-west roadway with a posted speed limit of 50 km/h. It has a sidewalk on both sides.

### 2.3 Key Intersections

Holburn Street with 6<sup>th</sup> Concession Road and Zurich Avenue are 4-leg and 3-leg unsignalized intersections. The intersections have the following configuration:

#### 6th Concession Road and Holburn Street

- Northbound approach has one left-through shared lane.
- Southbound approach has one through-right shared lane.
- Eastbound approach has one through-right shared lane, and “Stop” Control.
- Westbound approach has one through-right shared lane, and “Stop” Control.

#### 6th Concession Road and Zurich Avenue

- Northbound approach has one left-through shared lane, and “Stop” Control.
- Eastbound approach has one left-right shared lane.
- Westbound approach has one left-right shared lane.

## **2.4 Existing Traffic Volumes**

Traffic counts were taken at the intersections of 6th Concession Road with Holburn Street on July 26, 2022. Counts were taken by our sub-consultant; Pyramid Traffic Inc. Counts were recorded in 15-minute increments from 8:00am to 5:30pm. The existing traffic volumes and other relevant data are included in Appendix A.

## **3.0 FUTURE CONDITIONS**

### **3.1 Growth Rate**

For this study, a conservative growth rate of 3% per year was assumed to reflect growth in background traffic volumes. The projected traffic volumes are provided in Appendix B.

### **3.2 Future Background Development**

The surrounding users of 6th Concession Road and Holburn Street will continue to grow. At this time, no new future development is known within the vicinity of development except one to the north of Holburn Street, which is newly constructed. Hence, it is assumed that this new development's traffic is already accounted for in the traffic counts.

## **4.0 DEVELOPMENT TRAFFIC**

This section will describe the development access, trip generation, trip distribution and ultimate peak hour traffic.

### **4.1 Development Access**

Access to the development is provided from Spago Crescent. The developments' site plan is provided in Appendix A and new intersections have the following configuration:

#### **6th Concession Road and Access Road 1**

- Eastbound approach has left-right shared lane.
- Southbound approach has one left-through shared lane.
- Northbound approach has one through-right shared lane.

## 4.2 Trip Generation

The number of vehicle trips anticipated to be generated by the proposed development was calculated based on trip generation rates published by The Institution of Transportation Engineers (ITE) Trip Generation 9th Edition.

The development will consist of 26 townhouses. Based on ITE manual, ITE 210 single-family houses represent the worst case scenario and will be use to estimate development's trip.

Description of Land use, ITE codes, unit sizes, trip generation rate and trip generation for daily and peak hours are provided in Table 1. Appendix B provides detailed calculations and all relevant charts.

Table 1: Trip Generation

Use	ITE	UNITS	AADT	Trip Generated			
				AM Hour		PM Hour	
				In	Out	In	Out
<b>Proposed Development</b>							
Proposed Development Single Family House	210	26	248	5	15	16	10
<b>Total Trips</b>			<b>885</b>	<b>5</b>	<b>15</b>	<b>16</b>	<b>10</b>

## 4.3 Trip Distribution and Assignment

The proposed development traffic trip is based on shortest route to reach major city i.e., City of Windsor. The proposed traffic distribution is shown below and in figures 1.2, 2.2 and 3.2 (see Appendix B).

Table 2: Trip Distribution

From/To	Distribution
6th Concession Road	80%
Zurich Ave	20%
<b>Total</b>	<b>100%</b>

Detailed travelled patterns and trip assignment at intersections are provided in Figures 1.1, 2.1 and 3.1 (see Appendix B).

#### 4.4 Future Condition

Development traffic volumes were added to the forecasted (2025, 2030 and 2035) background traffic volumes to obtain corresponding total traffic volumes at intersections. The projected total future volumes are provided in Figures 1.3, 2.3, and 3.3 (see Appendix B).

#### 5.0 INTERSECTION OPERATIONS

The forecasted 2025, 2030 and 2035 traffic volumes for the study intersections are evaluated using the Synchro/Sim Traffic software, which automates the procedures contained in the Highway Capacity Manual 2010.

The future peak hours analysis results are included in Table 3, 4 and 5, and corresponding worksheets in Appendix C.

Table 3: 2025 Traffic Condition – Level of Service

Intersection	A.M. Peak Hour			P.M. Peak Hour

Table 5: 2035 Traffic Condition – Level of Service

Intersection	A.M. Peak Hour			P.M. Peak Hour		
	LOS	v/c	Delay (sec)	LOS	v/c	Delay (sec)
<b>Holburn Street and 6th Concession Rd (Unsignalized)</b>						
EB LTR	B	0.13	11.5	C	0.36	24.4
WB LTR	C	0.43	17.0	<b>F</b>	<b>1.03</b>	<b>111.1</b>
NB LTR	A	0.01	0.4	A	0.05	1.6
SB LTR	A	0.01	0.7	A	0.05	1.5
<b>Overall LOS</b>	<b>A</b>			<b>B</b>		
<b>Holburn Street and Zurich Avenue (Unsignalized)</b>						
EB TR	A	0.06	0.0	A	0.17	0.0
WB LT	A	0.0	0.1	A	0.01	0.4
NB LR	A	0.06	10.3	B	0.05	12.0
<b>Overall LOS</b>	<b>A</b>			<b>A</b>		

Under 2025, 2030 and 2035 future conditions, the intersections are projected to operate at an acceptable LOS during peak hours. However, westbound turning traffic operates at LOS F during 2030 and 2035 evening conditions. Hence, mitigation measures are required. Warrant analysis was completed and details are provided in the section below.

## 6.0 WARRANT ANALYSIS

### 6.1 Left and Right Turn Lane Warrants

#### Left Turn Lane

An assessment for the requirement of a left turn lane was completed for westbound traffic at the intersection of 6<sup>th</sup> Concession Road with Holburn Street using the MTO Geometric Design Guide. The results of the assessment are summarized in the table below:

Table 6: 2035 Left Warrants – Intersection of 6<sup>th</sup> Concession Rd and Holburn St

Criteria	AM Peak Hour Traffic Volumes	PM Peak Hour Traffic Volumes
Westbound Left Turn (WBL)	175	162
Advancing WB Volumes; Va	192	224
% Left Turn in Va	90%	72%
Opposing Traffic Southbound (EB)	76	96
Requirement; Justification	Not Req'd	Not Req'd

Figures EA-2 and EA-3 (see Appendix D) show that a left turn lane is not warranted on Bevel Line Road (CR33) and Torrey Pine Drive intersection. Results are provided in Appendix D.

#### Right Turn Lane

The right turn warrant analysis was carried out for the intersection of 6<sup>th</sup> Concession Road and Holburn Street. Based on MTO guidelines (Geometric Design Standards for Ontario Highways), if right-turning vehicles are more than 60vph or right turning vehicles create a hazard or reduce capacity at the intersection, right-turn lane warrants are needed.

Based on forecasted total traffic counts, an exclusive northbound right turn lane is needed for the 2025 condition.

## 6.2 Signal Warrant

Traffic signal warrant analysis was undertaken for the intersections of 6<sup>th</sup> Concession Road with Holburn Street. The analysis was based on the Transportation Association of Canada (TAC) traffic signal procedure which requires 100 warrant points to trigger a signal at the intersection.

Based on 2035 background traffic volumes, signals are warranted. Detailed calculations are provided in Appendix D.

## 6.3 Improved Intersection Analysis

As described in section 6.0, the improved intersection analysis was conducted and results are included in Table 7 and corresponding worksheets are included in Appendix C.

Table 7: Traffic Condition – Level of Service

Intersection	2030 PM PEAK TRAFFIC			2035 PM PEAK TRAFFIC		
	LOS	v/c	Delay (sec)	LOS	v/c	Delay (sec)
<b>Holburn Street and 6th Concession Rd (Unsignalized)</b>						
EB LTR	A	0.1	8.6	A	0.17	8.8
WB LTR	B	0.44	14.6	B	0.50	15.7
NB LTR	B	0.44	10.2	A	0.50	10.9
SB LTR	B	0.54	16.2	A	0.61	17.8
<b>Overall LOS</b>	<b>A</b>			<b>A</b>		

The intersection operates at an acceptable level of service during the 2030 and 2035 evening conditions.

## 7.0 CONCLUSION

Based on our review, we provide the following preliminary comments for the development:

- The existing site consists of three (3) buildings that be removed.
- The proposed development will have 26 townhouses, roadway and landscape areas in a 0.84ha area.
- The background growth rate of 2 percent was considered in the modelling as it represents the worst-case scenario.
- One full access road from Spago Crescent will be provided to serve the development. Spago Crescent forms the west-leg with Zurich Avenue within proximity of development.
- The proposed development is expected to generate 76 two-way trips during morning peak hours and 86 two-way trips during evening peak hours. It is anticipated that the development will be completed by 2023.
- The proposed access is a “3” leg intersection with a “Stop” control on the access road.
- Under future conditions, the intersections of Holburn Street with 6th Concession Road operates at an overall acceptable level of service during 2025, 2030 and 2035 morning and evening peak hours. However, westbound turning traffic operates at LOS F during 2030 evening conditions. Hence, improvement is required.
- Under future conditions, the intersections of 6th Concession Rd with Zurich Avenue operates at an overall acceptable level of service during 2025, 2030 and 2035 morning and evening peak hours.
- An exclusive right-turn lane is required for the 2025 condition.
- A traffic signal is warranted for the intersection of 6<sup>th</sup> Concession Road with Holburn Street under 2025 background and total traffic conditions.

- The improved Holburn Street with 6th Concession Road operates at an acceptable level of service.
- An adequate sight line distance is provided for a safe departure from the development.

In conclusion, upgrades are required for the existing intersection of 6<sup>th</sup> Concession Road with Holburn Street infrastructure in 2030 and 2035 background conditions. These upgrades are not due to the proposed development as the development's traffic will have minimum impact on the operation of existing intersections. Hence, we believe this conclusion is satisfactory for the City's.

All of which is respectfully submitted.

### Explanation of Factors:

- Cbt** = 1.05 if the side street either is a bus route, or has more than 10% trucks, otherwise = 1.00. (it is assumed that these two factors only affect the side street vehicles trying to cross the main street, not the pedestrians)
- Ci** = the product of the other 4 geographic factors (Cs = intersection spacing, Cmt = main street truck, Cv = Speed, Cp = Population)
- Vm1** = the main street volume - either the total of the two approaches or the highest single approach (if the median is >=10.0 metres) (averaged over 6 peak hours)
- Vm2** = the main street volume - either the total of the two approaches or the highest single approach (if the median is >=6.0 metres) (averaged over 6 peak hours)
- Vs** = the highest side street approach volume (averaged over 6 peak hours)
- \*\*\* note: it has been determined that Vs must be > 75 for signals to be considered \*\*\*
- F** = Pedestrian demographic factor - the maximum of the 3 individual pedestrian demographic factors
- Pc** = the total pedestrian volume crossing the mainstreet (averaged over 6 peak hours)
- L** = number of lanes that the pedestrians have to cross (only half the street if the median is >=5.0 metres)
- Kv** = Vehicle - Vehicle denominator constant (Kv = 1,100 if L<=3, Kv = 1,400 if L >3)
- Kp** = Vehicle - Pedestrian denominator constant (Kp = 2,000 if L<=3, Kp = 5,000 if L >3)
